➤ Movement In Animals

MOVEMENT IN ANIMALS

Animals move from place to place in search of food, water and shelter. Each group of animals have different organs for movement. Let us learn how they move. Animals move in different ways.

Animals like lions, rabbits and deer have legs. They walk and run on land.

Animals like snakes and earthworms do not have legs. They crawl on land.

Birds and some insects have wings that help them to fly in the air.

Fish have neither legs nor wings. They swim in water with their fins and tails.
